-- A B S T R A C T

A harness device for a weaving machine is made with partial apertured boards of synthetic material that can be manufactured by injection moulding. Each small partial apertured board has threading openings for pulling through harness cords, provisions to carry connecting elements and positioning means to position the connecting elements. Connecting elements connect one or several harness cords to one or several tackle cords or hooks. The threading openings or the connecting elements are provided with a spring-mounted retaining element and the connecting elements are provided with an opening through which one or several spindles may be passed.--
